ADD-ON · 2 NOVEMBER 2026

What changed on 2 Nov 2026: operator scan, phone floor screens, possible duplicate customers

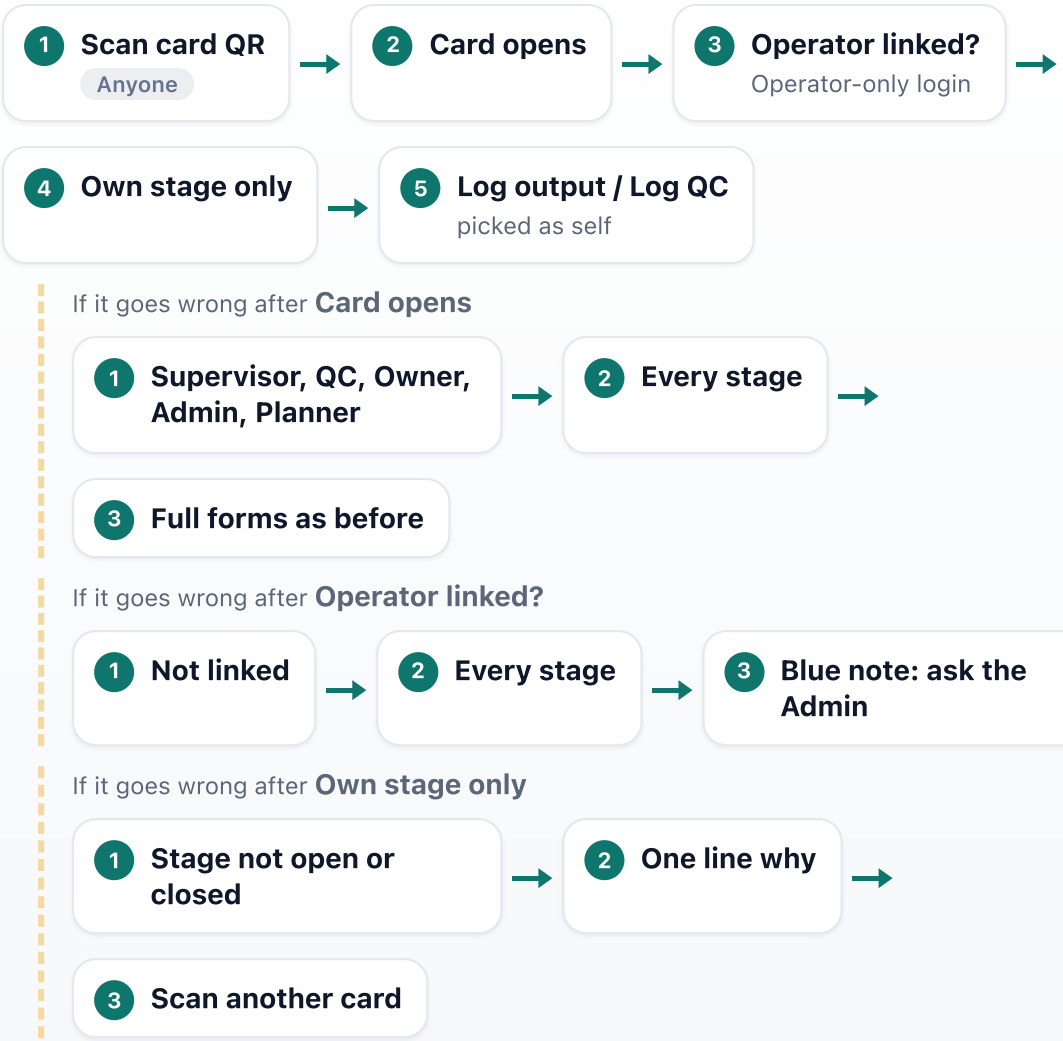

What it is: an add-on to the help guide for three changes made on 2 Nov 2026: an operator who scans a job card sees only their own stage, the floor screens on a phone are easier to use, and customers with nearly the same name are flagged as a possible duplicate.
Who uses it: Operators, Plant Managers (supervisors), QC and In-process QC, Planners, Sales, Owner and Admin.
Where: Scan (/scan) and the job card floor page (/production/entry/ followed by the card), the **Log output** and **Log QC** forms, Masters > Customers (/masters/customers), Masters > Employees (/masters/employees), Sales orders > New order (/sales-orders/new)

At a glance

- **An operator sees only their own stage.** When a login that has only the **Operator** role scans or opens a job card, and that login is linked to an employee in Masters > Employees, the card shows only the stage of that employee's department (Winding, Oven or Process). The operator is already picked as themselves in **Log output** and **Log QC**.
- **Everyone else keeps the full form.** Plant Manager (supervisor), Owner, Admin, Planner, QC, In-process QC and every other login see every stage, exactly as before. A login that has Operator plus any other role also sees every stage.
- **An operator who is not linked keeps the full form** with a small blue note: ask the Admin to link the login in Masters > Employees.
- **Phone screens:** the stage tabs (or the operator's single stage) and a **Scan** button stay pinned under the top bar; **Save** and **Cancel** stay pinned at the bottom of the forms; the first number to type is ready with the number keyboard; after saving, the next steps are one tap away (**Log QC for run ...**, **Log another run**, **Scan another card**, **Back to card**).
- **Possible duplicate customers** are only flagged: a **Possible duplicate** badge in Masters > Customers, a **Duplicates** filter, a note on the customer's detail panel, and a hint on a new sales order. Nothing is merged and nothing is blocked; users decide.
- No rule changed. The server still decides who may log, which operators a stage lists (only active employees of the stage's department) and what a run or a QC reading must contain.

The flow

Scanning a job card

The link between a login and an employee is the login email written on the employee's row in Masters > Employees. The stage comes from that employee's **Dept**: WINDER is Winding, OVEN is Oven, PROCESS is Process (PACKING is the Packing stage on older cards that still pack on the floor).

Possible duplicate customer

1. Open Masters > Customers — Sales/Admin
2. Filter Duplicates: Possible duplicates
3. Open the customer
4. Read the note
5. Same customer?
6. Deactivate the extra one — Owner/Admin

If it goes wrong after **Same customer?**

1. Different units
2. Nothing to do

Screen tour

Screens are described in words; the phone width is 390 pixels.

Operator: the card at their stage

*Figure (in words): the card number and customer at the top, then a dark green bar pinned under the top bar reading "Your stage: Oven · 0 of 100 bamboo good · " with a **Scan** button beside it; below, the Oven summary (not started, 0 / 100 bamboo, "50 bamboo ready from Winding"), two big buttons **Log output** and **Log QC**, the **Oven runs** list, and at the bottom **Scan another card** and **Open the full job card**.*

What you see:

1. **Card header**: card number (for example 26/10/315), status chip (Running), **Full card** link, customer, size, colour and pcs = bamboo × pcs per bamboo.
2. **Your stage bar** (pinned): your stage name, good so far against the target, and your name. There are no other stage tabs.
3. **Scan** (pinned, right of the bar): opens the floor picker to scan the next card.
4. **Stage summary**: status (not started, running, closed), good / target, rejected, runs with the supervisor, what is ready from the stage before, flagged runs.
5. **Log output** and **Log QC**: open the forms for your stage only.
6. **Still needs QC** (when a run of your stage waits for readings) and **runs**: only your stage's runs.

Operator: the card is not at their stage yet, or their stage is closed

Figure (in words): the same header and pinned "Your stage" bar, then one grey line with a lock: "This card is at Winding; Oven opens when Winding passes bamboo. Nothing to log here now." There are no Log output or Log QC buttons.

The line says exactly why, for example:

- "This card is at Winding; Oven opens when Winding passes bamboo."
- "This card is at Winding; Oven opens when Winding QC is recorded (25 bamboo waiting)."
- "Winding is closed on this card (100 bamboo good). The card is at Process now." (the closed stage's runs are still listed, read-only)
- "This card is closed; nothing more to log on Oven." (completed or cancelled card)

Supervisor and other roles: the full card

Figure (in words): the card header, then a pinned row of compact stage tabs (Winding 50/100, Oven 0/100, Process 0/1,200, Dispatch 0/1,200) with a small scan icon at the end; a small amber dot on a tab means runs are flagged or waiting for the supervisor. Below: the selected stage's summary, ***Log output****,* ***Log QC****,* ***Close*** *and the runs.*

Operator not linked

Figure (in words): above the stage tabs, a blue note: "Your login is not linked to an employee, so every stage is shown. Ask the Admin to link your login in Masters › Employees (your login email on your employee row)." Other wordings: the employee is in a department that runs no floor stage (QC, Store, General…), or the login email is on two employees in different departments; in both cases every stage is shown until the Admin fixes the row.

Log output on a phone (operator)

Figure (in words): a full-screen sheet titled "Log output · Oven" with the card number and customer under it. No stage chips at the top. Date (Today / Yesterday / Other), Shift (A 08–20, B 20–08), Oven no. chips, Operator with the operator's own name already selected, Helper (optional), then ***Made (bamboo)*** *and* ***Rejected (bamboo)*** *big number boxes, Good = Made − Rejected and Plan match. A bar pinned at the bottom shows "Still needed: …" and the* ***Cancel*** *and* ***Send to supervisor*** *buttons.*

When the sheet opens, the **Made** box (on Process, the **Bamboo taken from Oven** box) is focused and scrolled to the middle of the screen so the number keyboard does not hide it. In **Log QC** the first empty reading box is focused the same way. Qty and reading boxes open the number keyboard.

After saving

Figure (in words): a green tick, "Run O#1 sent to the supervisor", the card, stage, date and shift, a Made / Rejected / Good box, the plan match line, then four buttons: ***Log QC for run O#1 now****,* ***Log another run****,* ***Scan another card****,* ***Back to card****.* After **Save QC** the buttons are **QC for run …** (when another run is waiting), **Log another QC**, **Scan another card** and **Back to card**.

Masters > Customers: possible duplicates

Figure (in words): the customer list with a new ***Duplicates*** *filter (All / Possible duplicates (4)). A flagged row shows an amber* ***Possible duplicate*** *badge with "of Chokshi Texelin Pvt.Ltd. (WB-CTHOK)" beside it. The detail panel on the right has a* ***POSSIBLE DUPLICATE*** *chip and, on* ***Overview****, an amber note naming the other customer as a link.*

New sales order: hint

Figure (in words): under the ***Customer*** *dropdown, a small amber line: "Possible duplicate: Sharma Tubes Private Limited (ST-02) has a similar name. Check you picked the right customer."* The order can still be saved.

Step by step

How to link an operator's login (Admin)

1. Make the login in System > Users with the **Operator** role (only that role) and the plant.
2. Open Masters > Employees, find the person's row (or **+ New employee**), open it and press **Edit**.
3. Set **Dept** to the stage they run: WINDER, OVEN or PROCESS.
4. Type the person's login email in **Email**, exactly as they sign in (capital letters and spaces do not matter). Save.
5. The next time the operator opens a card, only their stage shows. To move them to another stage, change the **Dept**.

How an operator logs a run (Operator)

1. Scan the QR on the printed card (phone camera or **Scan** in the app). The card opens on your stage.
2. If a grey line says the stage is not open, there is nothing to do yet: press **Scan** for the next card.

3. Press **Log output**. Your name is already picked as Operator. Check Date, Shift and machine, type **Made** and **Rejected** (pick a rejection code when anything is rejected).
4. Press **Send to supervisor**. The run waits for the supervisor to check and submit it.
5. On the saved screen press **Log QC for run ... now**, type at least 2 readings per check and press **Save QC**; or press **Scan another card**.

How a supervisor works on the floor (Plant Manager, Owner, Admin)

Nothing changed: every stage is shown, the stage chips are at the top of each form, any department operator can be picked, and **Save run** posts at once. On a phone the stage tabs and the scan icon stay pinned while you scroll.

How to check possible duplicate customers (Sales, Owner, Admin)

1. Open Masters > Customers and set **Duplicates** to **Possible duplicates**.
2. Open a flagged customer. The **Overview** tab names the other customer(s); press a name to open it.
3. Compare GSTIN, address and orders. If both rows are the same customer, keep the one with the orders and **Deactivate** the other (Owner/Admin). If they are different (another unit or branch), leave both; the badge stays as a reminder.
4. When picking a customer on a new sales order, read the hint under **Customer** if it appears and make sure the right one is picked.

Rules the system enforces

- Operator scope is a **screen flow only** (no new rule). The server still checks every run and QC reading as before, including that the operator named is an active employee of the stage's department (owner decision of 1 Nov 2026).
- Scope applies only to a login whose **every role is Operator** and whose login email is on exactly one active employee row, in a department that runs a floor stage, in the card's plant. Otherwise the full form shows (with the note for an Operator-only login).
- A stage is "not open yet" for the operator when it has not started and nothing is ready from the stage before it (Winding after Slitting is always open). A running stage stays open for runs and QC.
- A closed stage, a completed card or a cancelled card shows the one-line status and no form to the operator. A supervisor can still add late QC readings to a completed card, as before.
- Old-form cards (made before the batch-entry form) keep their old entry form for everyone.

- Possible duplicates **only flag**: nothing is merged, deactivated or blocked automatically, and a sales order can still be saved for either customer.
- Names are compared after ignoring capital letters, punctuation, spaces and company words at the end (Pvt, Pvt.Ltd., Private Limited, Ltd, Limited, LLP). A small typo still matches (one letter in names under 10 letters, two in longer names; two swapped letters count as one).
- Text in square or round brackets is the unit: different units are different customers (" [Hazira]" and "[Silvassa]" are never flagged). A name without a unit can be flagged against a name with one.
- Names shorter than 5 letters must match exactly.

Sample

Customer A	Customer B	Flagged?	Why
Sharma Tubes Pvt Ltd	SHARMA TUBES PRIVATE LIMITED	Yes	same name after case and suffix
Reliance Industries Ltd	Relience Industries Limited	Yes	one-letter typo
Reliance Polyester Ltd [Silvassa]	Reliance Polyetser Ltd.[Silvassa]	Yes	swapped letters, same unit
Reliance Industries Limited [Hazira]	Reliance Industries Limited [Silvassa]	No	different units
Madelin Enterprises Ltd [Athola]	Madelin Enterprises Ltd [Saily]	No	different units

Operator example: Ramesh signs in as ramesh.winder@sharmatubes.in (role Operator). His employee row EMP-014 has Dept WINDER and that email. He scans card 26/10/315: he sees "Your stage: Winding · 20 of 60 bamboo good · Ramesh", logs Made 12, Rejected 0, presses **Send to supervisor**, then **Log QC for run W#3 now**. Suresh (Dept OVEN) scans the same card while Winding has passed nothing: he reads "This card is at Winding; Oven opens when Winding passes bamboo." and presses **Scan**.

Common questions

I am an operator and I see every stage. Why?

Your login is not linked. Read the blue note and ask the Admin to put your login email on your row in Masters > Employees with your department.

I work on Oven today instead of Winding. How do I log Oven?

Ask the Admin to change your **Dept** to OVEN, or ask the supervisor to log the run. The server only lists operators of the stage's own department anyway.

The card says my stage opens later. Can I log anyway?

No form is shown until the stage before passes output (or its QC is recorded). A supervisor can still take a batch before its QC with an override reason, as before.

Why is my name already picked as Operator?

Because your login is linked to your employee row. You can still pick a colleague of the same department if they ran the machine.

Does the supervisor see anything different?

Only the phone layout: stage tabs and scan stay pinned, and the saved screen has **Scan another card** and **Back to card**. The forms and rules are the same.

Where did "Done" go after saving?

It is now **Back to card**. **Scan another card** opens the floor picker straight away.

Two customers are flagged but they are different plants of the same company.

Put the plant in brackets in the name, for example "[Hazira]" and "[Silvassa]"; different units are never flagged. Otherwise leave the badge; it does not block anything.

Can the system merge two duplicate customers?

No. Keep the right one and deactivate the other; old orders keep pointing to the customer they were made for.
